                              *sbttl 'PHN$TRANSCRIBE_CMD - Handle TRANSCRIBE Command'
                                functional Description:
                                         This routine handles the TRANSCRIBE command, which is used to make a
                                         transcript of the onversation. We record the conversation that has taken place UP TO THIS POINT, but only for people we are currently
                                         talking to.
                                 Formal Parameters:
                                         trans_spec
                                                             The address of the descriptor of the file to receive
                                                             the transcript.
                                 Implicit Inputs:
                    0590
                                         global data
                    0591
                    0592
0593
                                 Implicit Outputs:
                                        global data
                    0594
                    0595
                                 Returned Value:
                    0596
